INŠTITUT ZA VODE REPUBLIKE SLOVENIJE | Institute for Water of the Republic of Slovenia

Voda za življenje, znanje za vode.
Water for Life, Knowledge for Water.

Poročilo o delu Inštituta za vode Republike Slovenije za leto 2014

vmesno poročilo, 21.3.2014

PROGRAMSKI SKLOP I:
STROKOVNA PODPORA MKO NA PODROČJU SKUPNE EU POLITIKA DO VODA

PROJEKT I/2:
PRIPRAVA IN ZAGOTOVITEV STROKOVNIH PODLAG ZA IZVAJANJE POPLAVNE DIREKTIVE (2007/60/ES)

Naloga I/2/5:
Izpolnitev evropskih poročevalskih obrazcev za karte poplavne nevarnosti in ogroženosti

Nosilec naloge:
Blažo Đurović, univ. dipl. inž. grad.

Ljubljana, marec 2014

PROGRAM:	Program dela IzVRS za leto 2014
NASLOV NALOGE:	Izpolnitev evropskih poročevalskih obrazcev za karte poplavne nevarnosti in ogroženosti
ŠIFRA NALOGE:	I/2/5
NAROČNIK:	MINISTRSTVO ZA KMETIJSTVO IN OKOLJE Dunajska c. 22 1000 Ljubljana
IZVAJALEC:	INŠTITUT ZA VODE REPUBLIKE SLOVENIJE Hajdrihova ul. 28c 1000 Ljubljana
NOSILEC NALOGE:	Blažo ĐUROVIĆ, univ. dipl. inž. grad.
AVTORJI:	Blažo ĐUROVIĆ, univ. dipl. inž. grad. Katja SOVRE, univ. dipl. inž. vod. in kom. inž.
SODELAVCI:	Dunja ZUPAN VRENKO, univ. dipl. inž. geod.
DIREKTOR IzVRS:	Igor PLESTENJAK, univ. dipl. prav.
	(žig)
KRAJ IN DATUM:	LJUBLJANA, marec 2014

KAZALO PRILOG

Priloga I (v digitalni obliki): Preglednice analize ogrožencev

Priloga II (v digitalni obliki): Preglednice in podatkovna baza vsebin poročanja

Priloga III: Izpolnjeni poročevalski obrazci (.xml)

1 NALOGA

1.1 Opis naloge

1.1.1 Izhodišča in pravni okvir

Uredba o vsebini in načinu priprave podrobnejšega načrta zmanjševanja ogroženosti pred poplavami (Ur. l. RS, št. 7/2010) v 13. členu določa, da mora ministrstvo zagotoviti karte poplavne nevarnosti in karte poplavne ogroženosti do 22. decembra 2013 in jih dati na razpolago Evropski komisiji najkasneje tri mesece po izdelavi.

1.1.2 Namen in vsebina

Za posredovanje rezultatov kartiranja EK so na voljo poročevalski obrazci, ki jih je treba preučiti in v njih vnesti razpoložljive podatke.

1.1.3 Cilji in pričakovani rezultati

Do 14. 3. 2014 bo odporočano 42 kart, preostalih 19 kart pa predvidoma do 15. 9. 2014 (glede na razpoložljive karte poplavne nevarnosti).

Rezultati naloge: Izpolnjeni poročevalski obrazci, letno poročilo o izvedenih delih

Datum oddaje rezultatov: 14. 3. 2014, 15. 9. 2014

1.2 Potek izvajanja naloge

Januar, 22 ur + 48 ur
Pregled obrazcev, priprava vsebin za povzetke, zasnova uporabe podatkov kart ogroženosti pri izpolnjevanju obrazcev, priprava podatkov.
Februar, 39 ur + 112 ur + 58 ur
Pregled vsebin in priprava statistike posameznih kart ogroženosti, primerjava s statistiko OPVP, določitev kriterijev relevantnosti za posamezne vrste ogrožencev, priprava povzetkov, zasnova poročila, priprava podatkov za poročevalske sheme, izvedba prostorskih analiz.
Marec, ca. 120 ur
Priprava in vnos podatkov v poročevalske obrazce, izvedba dodatnih prostorskih analiz za izdelavo statistike ogrožencev.

SKUPAJ REALIZIRANIH UR: ca. 399 ur
SKUPAJ NAPOVEDANIH UR: 535 ur (0,256 FTE)

1.3 Ocena opravljenega dela

Izdelana je statistika ogrožencev in delno so izpolnjeni obrazci za 38 od 61 območij pomembnega vpliva poplav. Za dokončanje poročanja po 6. členu poplavne direktive bo treba dopolniti 3 karte poplavne nevarnosti (OPVP Tržič, OPVP Črna na Koroškem in OPVP Kamna Gorica), dokončati izdelavo ene karte poplavne nevarnosti (OPVP Cerkno), za eno karto pridobiti digitalne podatke (OPVP Domžale) in v celoti izdelati karte poplavne nevarnosti za 8 območij pomembnega vpliva poplav, za ostalih 10 območij pa dopolniti obstoječe rezultate modeliranj, izdelati hidravlične modele za dele območij ali zmanjšati kriterij potrebne prostorske pokritosti (2/3) osnovnega sloja OPVP (preglednica 1-1).

Preglednica 1-1: Manjkajoče karte poplavne nevarnosti.

št.	Območje pomembnega vpliva poplav	HH študija - št. vira	Komentar	POKRITOST OPVP (%)
21	Nova Gorica	3127	DELNA POKRITOST; prevelika potencialnost OPVP - podatki OPKp verjetno niso upoštevali delovanja zadrževalnika Pikolud na Korenu ; *predlagamo uvrstitev med zelena območja (glavna vodotoka obdelana)*	34
29	Miren		za sosednjo občino Renče-Vogrsko obstaja nepotrjena študija	0
16	Idrija		DELNA POKRITOST; nepotrjena študija in več 1D analiz na območju OPVP-ja; OBČINA: za OPN izdelane študije (OPN Občine Idrija; Parkirišče pri Zagodu, Podenota LP_17/2_IG, ID_12/1_CU in ID_37_CU; OPPN Mejca v Idriji in Območje ob Ljubevščici, ki je v fazi izdelave), za nekatera območja (ID_12/1_CU in ID_37_CU) izvedeno LIDAR snemanje	28
19	Domžale	3413	POPOLNA POKRITOST; razredi različnih OHM združeni, globine pa ne - naročiti pri izdelovalcu! DIGITALNI PODATKI V PRIDOBIVANJU!	0.1
14	Stahovica - Kamnik	3406	DELNA POKRITOST (manjka del od Stahovice do sotočja z Nevljico)	34
42	Piran		določiti območja poplavljanja morja!	0
41	Izola	3041 3107 3159 3108 3064	ZELO SLABA POKRITOST, študiji za potoka Rikorvo in Morer upoštevata poplavljanje morja; določiti manjkajoča območja poplavljanja morja!	6
40	Kostanjevica na Krki		OBČINA: nič načrtovano	0
8	Dravograd		nepotrjena študija za 3. os po 5. členu - na karti pokritosti označeno z rdečo projekt Dramurci - poplavni scenariji za sotočje Meže z Mislinjo in Drave, vendar brez izrisanih kart poplavne nevarnosti, ni OHM - na karti pokritosti označeno z zeleno	0
53	Vojnik		OBČINA: izvajajo se protipoplavne ureditve	0
44	Vransko		MKO javno naročilo	0
2	Celje	3069	ZELO SLABA POKRITOST, OBČINA: nič načrtovano preveriti kohezijski projekt za izvedbo protipoplavnih ukrepov v Savinjski dolini	0.2

34	Zagorje ob Savi	3344	študije pokrivajo zelo majhna območja izven OPVP; OBČINA: nič načrtovano	0
38	Kisovec	3344	DELNA POKRITOST; brez pritokov Medije; *predlagamo uvrstitev med zelena območj (glavni vodotok obdelan)*	22
58	Sladki Vrh - tovarna papirja	3173	obstaja HH model	
54	Gornja Radgona	3173	DELNA POKRITOST; brez pritoka Mure; *predlagamo uvrstitev med zelena območj (glavni vodotok obdelan)*	44
50	Ptuj	3415	ZELO SLABA POKRITOST, potrjena študija za vodotok Grajena, morda le preveriti Q500 Drave, dogodek 2012 (približno Q500) ni ogrozil OPVP	0.4
57	Rogaška Slatina - steklarna		študija izven OPVP (odlagališče)	0
27	Odranci	3174	potrjeni študiji v bližini OPVP (daljnovod in sosednja občina Črenšovci); OBČINA: nič načrtovano	< 1%

2 UVOD

2.1 Vsebinska izhodišča

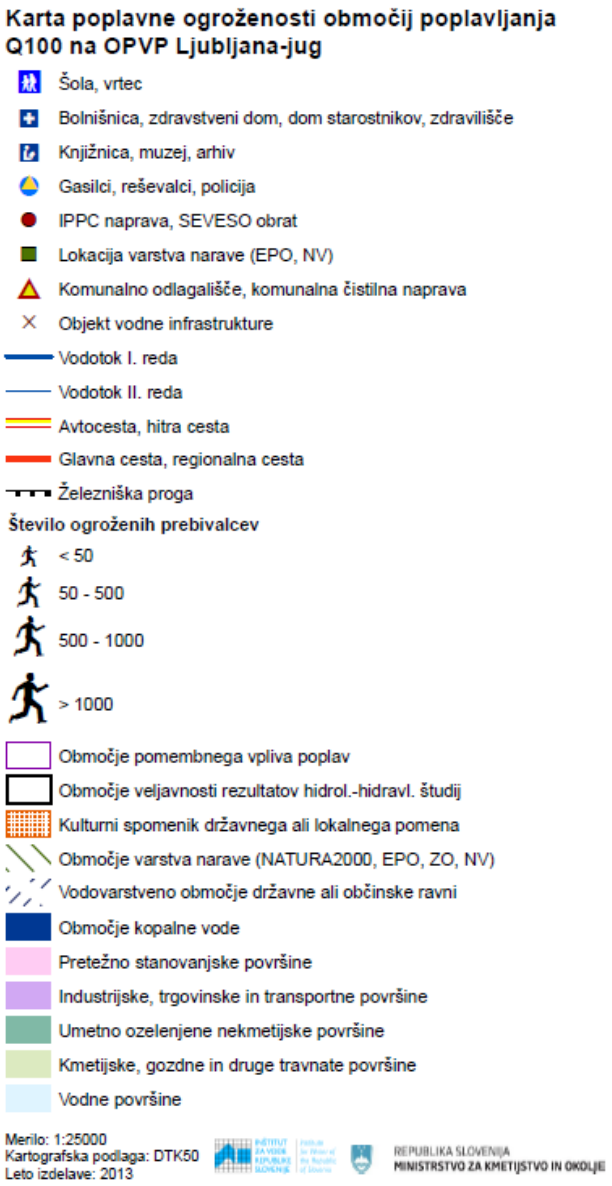
Na podlagi kart poplavne ogroženosti je treba določiti vrste in količino ogrožencev in s pomočjo teh informacij se bo v obdobju načrtovanja 2013-2015 določilo cilje in izbralo ukrepe za zmanjšanje poplavne ogroženosti. Decembra 2013 je bila zaključena izdelava kart ogroženosti za 33 območij pomembnega vpliva poplav, do marca 2014 je bilo izdelanih še 5 kart, do konca septembra 2014 pa predvidoma še preostalih 23 kart. Karte ogroženosti so izdelane v merilu 1:25.000 na kartografski podlagi DTK50 in uporabljene kot vsebinsko izhodišče za potrebe poročanja po 6. členu poplavne direktive.

Pri izdelavi kart poplavne ogroženosti so bili uporabljeni podatkovni sloji iz predhodne ocene poplavne ogroženosti 2009-2011:

- Integralna karta poplavne nevarnosti (IzVRS, december 2013)
- Državna topografska karta DTK 50 (GURS, 2010)
- Topografski podatki GKB 25 – vodotoki (GURS, 1996)
- Centralni register prebivalstva (MNZ RS, 2010)
- Register prostorskih enot – hišne številke (GURS, 2010),
- Register nepremične kulturne dediščine (MK RS, 2011),
- Podatki o premični kulturni dediščini – knjižnice, muzeji, arhivi (ZVKDS, 2011)
- Seznam vodovarstvenih območij (ARSO, 2011),
- Seznam kopalnih voda (ARSO, 2011),
- Komunalne čistilne naprave (ARSO, 2013)
- Register območij Natura 2000 (ARSO, 2011),
- Ekološko pomembna območja (ZRSVN, 2011),
- Naravne vrednote (ZRSVN, 2011),
- Zavarovana območja (ZRSVN, 2011),
- Register zavezancev IPPC direktive (ARSO, 2011),
- Register zavezancev SEVESO direktive (ARSO, 2011),
- Seznam poklicnih gasilskih enot (Gasilska zveza Slovenije, 2011),
- Seznam domov za starejše (MDDSZ RS, 2011),
- Podatki spletnega mesta Geopedia.si (Sinergise d.o.o., 2011) o lokacijah šol, vrtcev, bolnišnic, zdravstvenih domov, zdravilišč, prostovoljnih gasilskih društev, policijskih postaj, reševalnih postaj,
- Zbirni kataster gospodarske javne infrastrukture (GURS, 2011),
- Corine Land Cover (EEA, 2006).

Karte poplavne ogroženosti za 38 območij pomembnega vpliva poplav vsebujejo naslednje podatke (slika 2-1): šola, vrtec; bolnišnica, zdravstveni dom, dom starostnikov, zdravilišče; knjižnica, muzej, arhiv; gasilci, reševalci, policija; IPPC naprava, SEVESO obrat, lokacija in območje varstva narave (območja Natura2000, ekološko pomembna območja, zavarovana območja, naravne vrednote), komunalno odlagališče, komunalna čistilna naprava; objekt vodne infrastrukture; vodotok I. ali II. reda, avtocesta ali hitra cesta; glavna cesta ali regionalna cesta; železniška proga; elektrovod, vodovod, plinovod; število ogroženih prebivalcev na območju poplavljanja; območje veljavnosti rezultatov

hidrološko-hidravličnih študij; območje pomembnega vpliva poplav; kulturni spomenik državnega ali lokalnega pomena; vodovarstveno območje državne ali občinske ravni; območje kopalne vode; raba tal po nomenklaturi Corine Land Cover (preglednica 2-1); kartografska podlaga DTK50. Škodni potencial je prikazan na območjih poplavljanja Q10, Q100 in Q500 znotraj skupnega območja veljavnosti rezultatov hidrološko-hidravličnih modelov, označenih na integralni karti poplavne nevarnosti (IzVRS, 2013). Pri prikazu IPPC naprav in SEVESO obratov so izjemoma prikazani vsi objekti znotraj območja veljavnosti rezultatov in ne le tisti znotraj treh območij poplavljanja, saj sodijo ti objekti med pomembne ogrožence, geolocirani pa so točkovno in zato s prostorsko analizo ni mogoče zanesljivo določiti, ali se posamezen objekt nahaja delno znotraj ali izven območij poplavljanja. Objekti vodne infrastrukture so podobno kot vodotoki prikazani v smislu kartografske podlage.



Slika 2-1: Legenda karte poplavne ogroženosti.

Preglednica 2-1: Združevanje kategorij iz nomenklature Corine Land Cover (EEA, 2006).

1.1. URBANE POVRŠINE	pretežno stanovanjske površine
1.2. INDUSTRIJSKE, TRGOVINSKE, TRANSPORTNE POVRŠINE	industrijske, trgovinske in transportne površine
1.3. RUDNIKI, ODLAGALIŠČA, GRADBIŠČA	
1.4. UMETNO OZELENJENE NEKMETIJSKE POVRŠINE	umetno ozelenjene nekmetijske površine
2.1. NJIVSKE POVRŠINE	kmetijske, gozdne in druge travnate površine
2.2. TRAJNI NASADI	
2.3. PAŠNIKI	
2.4. MEŠANE KMETIJSKE POVRŠINE	
3.1. GOZD	
3.2. GRMOVJE IN/ALI ZELIŠČNO RASTLINSTVO	
3.3. NEPORASLE POVRŠINE Z MALO ALI BREZ VEGETACIJE

4.2. OBALNA MOČVIRJA	
5.1. CELINSKE VODE	vodne površine
5.2. MORJE	

2.2 Podatki

Pri izpolnjevanju evropskih poročevalskih obrazcev so bili uporabljeni podatki izdelanih kart poplavne ogroženosti za 38/61 območij pomembnega vpliva poplav (slika 2-2). Kot izhodiščna vrednost za vrsto in količino ogrožencev so uporabljene statistike, izdelane že za območja pomembnega vpliva poplav, ki pa so zaradi ravni obdelave in rezultatov v merilu 1 : 50.000, obremenjene s preveliko potencialnostjo ogroženosti (preglednica 2-2).

Preglednica 2-2: Statistika ogrožencev OPVP.

Podobne preglednice se izpolnjujejo tudi za srednjo in majhno verjetnost poplav in nato se vsebine pretvorijo v .xml format.

3.3 Šifriranje vrste ogrožencev

Na podlagi informacij, ki jih lahko razberemo iz kart ogroženosti, je treba določiti ustreznike v poročevalskih obrazcih. Vsebina kart ogroženosti je pretvorjena v nomenklaturo poročevalskih obrazcev na naslednji način:

Ogroženec (karta poplavne ogroženosti)	**GJI - GURS, ARSO**	**GEOPEDIA, ZVKDS**	**PRS - AJPES**	**Šifra (poročevalski obrazec)**
Število ogroženih prebivalcev (*zaokroženo na 50 oz. 10*)				Število ogroženih prebivalcev
Pretežno stanovanjske površine				B41 - nepremičnine
Industrijske, trgovinske in transportne površine	Avtocesta, hitra cesta; Glavna cesta, regionalna cesta; Železnica; *Elektrovod;* *Vodovod, plinovod* IPPC naprava, SEVESO obrat		Število poslovnih subjektov	B44 – gospodarski sektorji (tudi če je ogrožen IPPC ali SEVESO) B42 – infrastruktura (če je ogrožen odsek ceste, železnice *ali oskrbovalnega voda*)
Umetno ozelenjene nekmetijske površine				B41 - nepremičnine
Kmetijske, gozdne in druge travnate površine				B43 – kmetijstvo, gozdarstvo, ribištvo, rudarstvo
Vodne površine				B43 – kmetijstvo, gozdarstvo, ribištvo, rudarstvo
IPPC naprava, SEVESO obrat	Komunalno odlagališče, komunalna čistilna naprava			B23 – potencialni viri onesnaženja
Območja varstva narave (Natura2000, EPO, ZO, NV), VVO, KV				B22 – območja Natura2000, vodovarstvena območja, kopalne vode
Kulturni spomenik državnega ali lokalnega pomena		Knjižnice, muzeji, arhivi		B31 – kulturna dediščina

				B32 – kulturna krajina (če TIP=kulturna krajina ALI zgodovinska krajina)
		Šola, vrtec; Bolnišnica, zdravstveni dom, dom starostnikov, zdravilišče; Gasilci, reševalci, policija		B45 - drugo

3.4 Popis in statistika ogrožencev

3.4.1 Razmejitev območij veljavnosti rezultatov

Območja veljavnosti rezultatov, ki pripadajo posameznemu območju pomembnega vpliva poplav, so bila za potrebe analiz razmejena po naslednjih kriterijih:

1.) Po mejah OHM
2.) Po zoženi poplavni liniji Q500
3.) Po cestnih premostitvah
4.) Po razvodnici
5.) Po sredini poplavnega območja, približno v okolici največje zožitve poplave Q500, sicer Q100, sicer Q10, kjer ta zožitev obstaja

3.4.2 Statistika ogrožencev na kartah ogroženosti

Za potrebe poročanja je bila izdelana nova statistika ogrožencev oziroma popis vrste in količine ogrožencev glede na:

- število prebivalcev; op.: pri določitvi OPVP je bil apliciran kriterij relevantnosti > 200 prebivalcev.
- število IPPC in SEVESO zavezancev; v podatkovnem sloju so IPPC naprave predstavljene točkovno, zato je vprašljiva dejanska ogroženost
- površina CLC; op:. pri OPVP je bil apliciran kriterij relevantnosti poplavno ogroženega območja > 0,1 km2, vendar je zaradi slabe natančnosti podatkov pri industrijskih in stanovanjskih površinah kot relevantna smiselno upoštevati vsa ogrožena območja, tudi najmanjša
- število poslovnih subjektov; zaradi pomanjkljivega podatkovnega sloja je kot relevantno upoštevano že najmanjše število poslovnih subjektov
- število kulturnih spomenikov; upoštevajo se kulturni spomeniki državnega ali lokalnega pomena in med temi ločeno kulturna in zgodovinska krajina
- površina območij varstva narave (Natura2000, ekološko pomembna območja, zavarovana območja narave, naravne vrednote)

- površina vodovarstvenih območij
- površina kopalnih voda
- dolžina pomembnejše linijske GJI (avtoceste, hitre ceste, glavne in regionalne ceste, železnice)
- število občutljivih objektov (šole, vrtci; bolnišnice, zdravstveni domovi, domovi starostnikov, zdravilišča; knjižnice, muzeji, arhivi)
- število objektov služb za ukrepanje v sili (gasilci, reševalci, policija)

3.4.3 Določitev ogrožencev na podlagi ortofoto posnetkov

Pri določanju števila IPPC zavezancev je s ciljem izboljšanja rezultatov prostorske analize ponekod izveden pregled situacije v merilu 1:5.000 na podlagi digitalnih ortofoto posnetkov in podatkovnih slojev kart poplavne nevarnosti. Smiselno bi bilo določiti tudi potencialno ogroženo zavarovano območje po vodni direktivi (glede na doseg in jakost onesnaženja).

3.5 Povzetki

3.5.1 Povzetek 1 – karte poplavne nevarnosti

-metode določitve, vrednotenja dosega (natančnost DMR), povratnih dob (izbira povrstnih dob), globin; hitrosti (kjer potrebno); uporabljenih modelov, podatkov, negotovosti in če so bile vključene podnebne spremembe.

Zahteve poplavne direktive v zvezi s kartiranjem poplavne nevarnosti in ogroženosti so v nacionalni pravni red prenesene z Uredbo o vsebini in načinu priprave podrobnejšega načrta zmanjševanja ogroženosti pred poplavami (Ur. l. RS, št. 7/2010), ki določa vsebino kart, način priprave kart pa določa Pravilnik o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007). Metodološki pravilnik opredeljuje verjetnosti nastanka poplavne nevarnosti s standardnimi verjetnostmi nastopa pretokov s povratnimi dobami 10, 100 in 500 let, ki povzročijo poplavo. Za določitev vrednosti pretokov s petstoletno povratno dobo pravilnik dopušča poenostavljen izračun vrednosti, torej, za površino porečja nad 1000 km2 po enačbi Q500 = 1,2 * Q100, za površino porečja do 1000 km2 po enačbi Q500 = 1,3 * Q100 in za površino porečja do 100 km2 pa Q500 = 1,4 * Q100. Poplavljanje stoječih voda in morja je opredeljeno z vrednostmi gladin s povratnimi dobami 10, 100 in 500 let, katerih vrednosti se v primeru stoječih voda določijo z najvišjim izmerjenim ali izračunanim vodostajem, v primeru morja pa s seštevkom vrednosti gladine plimovanja s povratno dobo 10, 100 in 500 let in pripadajočega vala s povratno dobo 2, 2 oziroma 50 let.
Od leta 2007 naprej se navedeni poplavni scenariji uporabljajo pri izdelavi hidrološko-hidravličnih študij v postopkih pridobitve vodnega soglasja za posege v prostor, ki bi lahko trajno ali začasno vplivali na vodni režim ali stanje voda, torej pri posegih na poplavna območja. Karte poplavne nevarnosti in zlasti karte razredov poplavne nevarnosti, ki nastanejo s prostorskim kombiniranjem dosegov različnih povratnih dob, razredov globin

in hitrosti, se uporabljajo kot strokovna podlaga za prostorske pogoje in omejitve kot jih določa Uredba o pogojih in omejitvah za izvajanje dejavnosti in posegov v prostor na območjih, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja (Ur. l. RS, št. 89/2008), katere izvajanje predstavlja razmeroma uspešen preventivni ukrep s ciljem omejitve oziroma zmanjšanja vnosa novega škodnega potenciala na poplavna območja.

V okviru predhodne ocene poplavne ogroženosti je bilo v Sloveniji opredeljenih 61 območij pomembnega vpliva poplav in za približno polovico območij je bilo treba v letih 2012 in 2013 zbrati razpoložljive podatke o poplavnih dosegih in globinah iz hidrološko-hidravličnih študij, izdelanih v letih 2007-2013 in potrjenih v postopkih preverjanja skladnosti z določbami metodološkega pravilnika, za preostalo polovico območij pomembnega vpliva poplav pa na novo izdelati karte poplavne nevarnosti oziroma jih prostorsko dopolniti. Karte poplavne nevarnosti se izdelujejo v merilu 1:5.000 ali večjem, na njih so prikazani dosegi 10, 100 in 500-letnih poplavnih voda in pri Q100 pripadajoči trije razredi globin (<0,5m; 0,5-1,5m; >1,5m) oz. na območjih s hitrostmi toka nad 1 m/s tudi trije razredi zmnožka globin in hitrosti toka (<0,5m2/s; 0,5-1,5m2/s; >1,5m2/s).

Kartiranje nevarnosti v splošnem temelji na enodimenzijskem hidrološkem modelu padavinskega odtoka na podlagi verjetnostne analize padavin oziroma podatkov vodomernih postaj ter na kombiniranem 1D-2D hidrodinamičnem modelu. Pri modeliranju so uporabljeni podatki temeljnih topografskih načrtov v merilu 1:5.000, podatki hidrogeološke karte, karte hidravlične prevodnosti tal, podatki o pokrovnosti Corine Land Cover, podatki DMV5m in podatki DMR1m, dobljeni s pomočjo LiDAR tehnike zajema geodetskih podatkov z višinsko natančnostjo ca. 7,5 cm in gostoto 10pik/m2, kakor tudi podatki terestričnega geodetskega snemanja prečnih profilov strug glavnih vodotokov in pritokov, premostitev, pragov, prepustov in drugih hidravlično pomembnih objektov ter podatki katastra stavb. Uporabljeni so naslednji podatki LiDAR snemanj: klasificirane točke, dobljene iz georeferenciranega oblaka točk z elipsoidnimi višinami, ki so uporabne na pritokih brez izmerjenih profilov; točke na razdalji 1m z nadmorskimi višinami, dobljene na podlagi interpolacije oblaka točk reliefa z nadmorskimi višinami; ortofoto posnetki. Za modeliranje padavine-odtok je uporabljeno programsko orodje HEC-HMS, za hidravlično modeliranje v strugi in na območjih poplavljanja MIKE Flood, prostorske analize in kartiranje pa se je izvajalo z ArcGIS. Vpliv podnebnih sprememb oziroma vpliv napovedi sprememb povratnih dob obstoječih karakterističnih vrednosti pretokov v hidroloških analizah ni bil upoštevan, z analizo vseh zabeleženih padavinskih in pretočnih vrednosti pa je upoštevana podnebna spremenljivost. Dolgoročni načrtovani razvoj v analizah ni bil upoštevan, saj je od leta 2008 naprej vnos novega škodnega potenciala na poplavna območja omejen z določbami Uredbe o pogojih in omejitvah za izvajanje dejavnosti in posegov v prostor na območjih, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja (Ur. l. RS, št. 89/2008), v primeru širitve urbanizacije pa je predvideno, da se predhodno z omilitvenimi ukrepi zagotovi zmanjšanje obstoječe ogroženosti.

Podatkovni sloji karte poplavne nevarnosti, ki se nahajajo znotraj območij veljavnosti rezultatov hidrološko-hidravličnega modeliranja, se zbirajo in na pol leta posodobijo ter javno objavijo v rubriki VODE\POPLAVE v Atlasu okolja, ki ga vodi Agencija za okolje Republike Slovenije (gis.arso.gov.si/atlasokolja/). Osnovni namen objavljenih podatkovnih slojev je podrobnejši prikaz poplavnih razmer na določenem območju in zagotavljanje strokovne podlage za razvrščanje območij poplavljanja v razrede poplavne nevarnosti. Podatki so namenjeni tudi načrtovanju ukrepov zmanjševanja poplavne ogroženosti, načrtovanju prostorskih ureditev in posegov v prostor, obveščanju in ozaveščanju

javnosti, načrtovanju ukrepov zaščite in reševanja, ter izvajanju mednarodnih obveznosti. Karte poplavne nevarnosti za posamezna območja pomembnega vpliva poplav, skupaj s tabelaričnim okvirjem spremljanja aktivnosti izvajanja poplavne direktive so objavljene na spletni strani MKO (mko.gov.si/si/delovna_podrocja/voda/poplavna_direktiva/). Evidenco hidrološko-hidravličnih študij, izdelanih skladno z določbami metodološkega pravilnika, vodita Agencija za okolje Republike Slovenije in Inštitut za vode Republike Slovenije, ki sodelujeta v postopkih preverjanja skladnosti študij z metodološkim pravilnikom.

3.5.2 Povzetek 3_1 – prebivalci

-metoda (vključno s kriteriji) določitve števila ogroženih prebivalcev za posamezen scenarij

Število ogroženih prebivalcev znotraj dosega posameznega poplavnega scenarija je določeno na podlagi prostorske analize podatkov Centralnega registra prebivalstva (Ministrstvo za notranje zadeve Republike Slovenije, 2014) in podatkov Registra prostorskih enot – evidence hišnih številk (Geodetska uprava Republike Slovenije, 2014). Upoštevani so stalni in začasni prebivalci, število ogrožencev je zaokroženo na 50 in na kartah poplavne ogroženosti simbolično prikazano na podlagi razvrstitve v štiri razrede (<50, 50-500, 500-1000, >1000).

3.5.3 Povzetek 3_2 – gospodarske dejavnosti

-metoda (vključno s kriteriji) določitve tipa ogroženih gospodarskih dejavnosti za posamezen scenarij

Vrste ogroženih gospodarskih dejavnosti znotraj dosega posameznega poplavnega scenarija so določene na podlagi prostorske analize podatkovnega sloja rabe tal po nomenklaturi Corine Land Cover (European Environment Agency, 2006). Nacionalni podatkovni sloj dejanske rabe tal v merilu 1:5.000 (Ministrstvo za kmetijstvo in okolje, 2013) žal ne vključuje ločene kategorije »industrijske, trgovinske in transportne površine«, ampak ločuje med pozidanimi, kmetijskimi, gozdnimi in ostalimi zemljišči. Kljub premajhnemu merilu podatkovnega sloja so bile kategorije Corine Land Cover ustrezno reklasificirane v pet kategorij za prikaz na kartah ogroženosti in izdelavo popisa ogrožencev. S ciljem izboljšanja natančnosti informacij v zvezi z omenjeno kategorijo je bilo na podlagi prostorske analize Poslovnega registra Slovenije (Agencija Republike Slovenije za javnopravne evidence in storitve, 2010) in podatkov Registra prostorskih enot – evidence hišnih številk (Geodetska uprava Republike Slovenije, 2014) določeno število poslovnih subjektov (gospodarske in negospodarske dejavnosti) znotraj dosega posameznega poplavnega scenarija. Za izboljšanje kakovosti informacij v zvezi s kategorijo »transportne površine« so bili uporabljeni podatki Zbirnega katastra Gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011) o poteku tras cest in železnic.

3.5.4 Povzetek 3_3 – IPPC zavezanci

-metoda (vključno s kriteriji) določitve lokacij IED inštalacij za posamezen scenarij

Industrijske naprave, zavezanci IPPC direktive, ki se nahajajo znotraj dosega posameznega poplavnega scenarija, so določeni na podlagi prostorske analize podatkov Registra zavezancev IPPC (Agencija za okolje Republike Slovenije, 2014), objavljenih tudi v registru E-PRTR European Pollutant Release and Transfer Register (European Environment Agency). S ciljem izboljšanja natančnosti informacij v zvezi s potencialnim onesnaženjem so kartam poplavne ogroženosti dodani podatkovni sloji komunalnih čistilnih naprav (Agencija za okolje Republike Slovenije, 2013), komunalnih odlagališč iz Zbirnega katastra gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011) in prostorski podatki Registra zavezancev SEVESO direktive (Agencija za okolje Republike Slovenije, 2014). Prostorska analiza teh slojev in slojev dosegov poplav je opredelila poplavno ogroženost posameznega IPPC zavezanca, pri čemer velja opozoriti na pomanjkljivost podatkovnega sloja, ki vsebuje točkovne objekte in ne poligonskih, zato obstaja možnost, da kljub poplavljenemu delu območja industrijske naprave, prostorska analiza objekta ne zazna kot ogroženca. Ravno zato so na kartah ogroženosti prikazane vse industrijske naprave (in tudi SEVESO obrati) znotraj območja veljavnosti rezultatov hidravličnega modela, za preveritev števila ogroženih IPPC zavezancev na poplavnih območjih različnih povratnih dob pa je bil poleg prostorskih analiz izveden pregled situacije v merilu 1:5.000 na podlagi digitalnih ortofoto posnetkov in podatkovnih slojev kart poplavne nevarnosti.

3.5.5 Povzetek 3_4 – območja vodne direktive

-metoda (vključno s kriteriji) določitve vpliva na WFD območja za posamezen scenarij

Določitev vpliva poplav na zavarovana območja okvirne vodne direktive, ki se nahajajo znotraj dosega posameznega poplavnega scenarija, je bila izvedena s pomočjo prostorskih analiz podatkovnih slojev vodovarstvenih območij, kopalnih voda, območij Natura2000, ki jih vodi Agencija za okolje Republike Slovenije (2011) in podatkovnih slojev ekološko pomembnih območij, naravnih vrednot in zavrovanih območij narave (Zavod Republike Slovenije za varstvo narave, 2011). Na kartah poplavne ogroženosti so območja Natura2000, ekološko pomembna območja, zavarovana območja narave in naravne vrednote združena v skupno območje varstva narave. Na kartah so prikazana tudi vodovarstvena območja, opredeljena z vladnimi uredbami in občinskimi odloki ter območja kopalnih voda, ki so opredeljena z Uredbo o upravljanju kakovosti kopalnih voda (Ur. l. RS, št. 25/2008). Prostorska analiza omenjenih podatkovnih slojev in slojev dosegov poplav je opredelila vpliv poplav na zavarovana območja okvirne vodne direktive.

3.5.6 Povzetek 3_5 – drugi podatki po členu 6(5d)

-metoda (vključno s kriteriji) določitve vrste drugih obravnavanih informacij po členu 6(5d) za posamezen scenarij

Poleg ogroženosti zdravja ljudi, okolja, gospodarskih dejavnosti in kulturne dediščine se po Pravilniku o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007) obravnava tudi ogroženost občutljivih objektov, torej objektov, kjer je lahko otežena evakuacija (šole, vrtci, bolnišnice, zdravstveni domovi, domovi starostnikov in zdravilišča), kjer lahko nastanejo izjemne materialne in družbene škode (knjižnice, muzeji, arhivi) oziroma katerih poškodbe lahko povzročijo velike posredne gospodarske škode (transport, oskrba). Kot posebna vrsta ogrožencev so na kartah ogroženosti obravnavane tudi lokacije objektov služb za ukrepanje v sili (gasilske, reševalne in policijske postaje) ter komunalne čistilne naprave in komunalna odlagališča kot potencialni vir onesnaženja voda v primeru poplav. Za kartografski prikaz ogrožencev in analizo njihovega števila so bili uporabljeni podatkovni sloji Zbirnega katastra Gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011), evidence pristojnih ministrstev, Zavoda za varstvo kulturne dediščine (2011), Gasilske zveze Slovenije (2011), Ministrstva za delo, družino, socialne zadeve in enake možnosti (2011) in spletnega mesta Geopedia.si (Sinergise, d.o.o., 2011). Ogroženost kulturne dediščine je bila prikazana in analizirana na podlagi podatkov Registra nepremične kulturne dediščine (Ministrstvo za kulturo Republike Slovenije, 2011). Prostorska analiza omenjenih podatkovnih slojev in slojev dosegov poplav je opredelila vpliv na občutljive objekte, večje vire onesnaženja, objekte služb za ukrepanje v sili in na kulturno dediščino.

3.5.7 Povzetek 5 – karte poplavne ogroženosti

-pojasnila, kako razumeti vsebino kart, merilo, namen/uporabo, natančnost, legendo, datum izdaje, odgovorne uprave, spletne povezave javnih objav

Na podlagi kart poplavne nevarnosti, izdelanih v merilu 1:5.000, je bilo treba določiti lokacijo, vrsto in količino ogrožencev in na podlagi teh informacij se bo v načrtovalskem obdobju 2013-2015 določilo primerne cilje in izbralo ustrezne ukrepe za zmanjšanje poplavne ogroženosti območij pomembnega vpliva poplav. Osnovni namen izdelave kart poplavne ogroženosti za območja pomembnega vpliva poplav je prostorski prikaz škodnega potenciala, ki se nahaja znotraj dosega posameznega poplavnega scenarija, na ravni merila državnega načrtovanja (1:25.000). Pri izdelavi kart poplavne ogroženosti so bili večinoma uporabljeni podatkovni sloji za določitev škodnega potenciala iz predhodne ocene poplavne ogroženosti 2009-2011, za kartografsko podlago pa je uporabljena Državna topografska karta DTK50 (Geodetska uprava Republike Slovenije, 2010) in topografski podatki o vodotokih GKB25 (Geodetska uprava Republike Slovenije, 1996). Karte poplavne ogroženosti vsebujejo naslednje podatke: šola, vrtec; bolnišnica, zdravstveni dom, dom starostnikov, zdravilišče; knjižnica, muzej, arhiv; gasilci, reševalci, policija; IPPC naprava, SEVESO obrat, lokacija in območje varstva narave (območja Natura2000, ekološko pomembna območja, zavarovana območja, naravne vrednote), komunalno odlagališče, komunalna čistilna naprava; objekt vodne infrastrukture; vodotok I. ali II. reda, avtocesta ali hitra cesta; glavna cesta ali regionalna cesta; železniška proga; število ogroženih prebivalcev na območju poplavljanja; območje veljavnosti rezultatov hidrološko-hidravličnih študij; območje pomembnega vpliva poplav; kulturni spomenik državnega ali lokalnega pomena; vodovarstveno območje državne ali občinske ravni; območje kopalne vode; raba tal po nomenklaturi Corine Land Cover. Škodni potencial je prikazan na območjih poplavljanja Q10, Q100 in Q500 znotraj skupnega območja

veljavnosti rezultatov hidrološko-hidravličnih modelov, le pri IPPC napravah in SEVESO obratih so izjemoma prikazani vsi objekti znotraj območij veljavnosti rezultatov hidrološko-hidravličnih študij in ne le znotraj treh poplavnih območij, saj sodijo ti objekti med pomembne ogrožence, geolocirani pa so točkovno in zato ni mogoče zanesljivo vedeti, ali se območje objekta nahaja delno znotraj območij poplavljanja. Objekti vodne infrastrukture so prikazani v smislu kartografske podlage.

Karte poplavne nevarnosti izkazujejo določene omejitve pri uporabi, npr. kljub sodobnim tehnikam zajema podatkov in modeliranja se rezultati lahko razlikujejo od zabeleženih poplavnih dogodkov zaradi: geomorfoloških sprememb in erozijskih učinkov ter njihovega vpliva na hidravlične razmere in pretočnost strug vodotokov; nepredvidenih zamašitev mostov in prepustov zaradi večje količine drobirja in plavja; tehničnih omejitev glede velikosti mrežnih celic, števila profilov in objektov; geodetskih podatkov (terenska izmera profilov, objektov, prepustov in premostitev na vseh pritokih). Poleg tega je praksa pri hidravličnem modeliranju taka, da se stavbe pri modeliranju upošteva kot visoke zidove in posledično se v rezultatih modeliranja take stavbe znajdejo izven poplavnega območja, čeprav voda z določeno globino sega do zunanjega gabarita stavbe.

Karte poplavne ogroženosti izkazujejo omejitve pri uporabi predvsem zaradi merila izdelave, sama statistika ogrožencev pa je zaradi natančnosti vhodnih podatkov pri nekaterih vrstah ogrožencev manj zanesljiva. Zaradi različne ravni prostorskih analiz in različnih uporabljenih podatkov o poplavni nevarnosti se ponekod slabše ujemata analiza ogrožencev območij pomembnega vpliva poplav in analiza ogrožencev poplavnih območij kart poplavne ogroženosti, glavni razlog pa je prevelika potencialnost ogroženosti območij pomembnega vpliva poplav. Pri prostorskih analizah predstavljajo težavo tudi točkovni podatki namesto poligonskih, ki poslabšajo natančnost glede na natančnost podatka o dosegih poplav, zato je treba ponekod situacijo pregledati s pomočjo digitalnih ortofoto posnetkov v merilu 1:5.000.

Določitev in prikaz poplavnih območij je predvidena v vodnem katastru in prostorskem informacijskem sistemu s Pravilnikom o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007), skupaj z obnovo in dopolnitvijo podatkov na šest let. Podatkovni sloji kart poplavne nevarnosti so javno objavljeni v rubriki VODE\POPLAVE na spletnem Atlasu okolja, ki ga vodi Agencija za okolje Republike Slovenije (gis.arso.gov.si/atlasokolja/). Izdelane karte poplavne nevarnosti in karte poplavne ogroženosti za območja pomembnega vpliva poplav so objavljene v preglednici na spletnem naslovu Ministrstva za kmetijstvo in okolje Republike Slovenije:

http://www.mko.gov.si/fileadmin/mko.gov.si/pageuploads/podrocja/voda/opvp/OPOPO.xls

Osnovni namen objavljenih podatkovnih slojev je prikaz poplavnih razmer na določenem območju, podatki pa so namenjeni tudi načrtovanju ukrepov zmanjševanja poplavne ogroženosti, načrtovanju prostorskih ureditev in posegov v prostor, obveščanju in ozaveščanju javnosti, načrtovanju ukrepov zaščite in reševanja, ter izvajanju mednarodnih obveznosti.

4 REZULTATI DELA

Izpolnjeni so bili poročevalski obrazec za karte poplavne nevarnosti in karte poplavne ogroženosti po 6. členu direktive 2007/60/ES. Na podlagi izdelanih kart poplavne ogroženosti in prostorskih analiz ogrožencev je bila z uporabo enotnega šifranta določena vrsta in ponekod tudi količina ogrožencev na območjih poplavljanja z 10, 100 in 500-letno povratno dobo za 38/61 območij pomembnega vpliva poplav.

Pripravljene so štiri .xml datoteke, dve datoteki za vodno območje Donave (SI_RBD_1_FHRM_20140320.xml in SI_RBD_1_FHRM_LinkToMS_20140320.xml) in dve za vodno območje Jadranskih rek z morjem (SI_RBD_2_FHRM_20140320.xml in SI_RBD_2_FHRM_LinkToMS_20140320.xml).

Rezultati dela se nahajajo v prilogi I (preglednice analize ogrožencev), prilogi II (preglednice in podatkovna baza poročevalskih vsebin) in prilogi III (izpolnjeni poročevalski obrazci).

5 ZAKLJUČEK

Pri poročanju po 6. členu poplavne direktive se je izhajalo iz podatkov kart poplavne ogroženosti in se ni podrobneje opredeljevalo glede kriterijev relevantnosti vrste in količine ogrožencev za posamezno območje pomembnega vpliva poplav, saj se šele v postopku priprave načrta določijo podrobnejši cilji zmanjševanja poplavne ogroženosti za posamezna območja. Poročevalski obrazci vsebujejo popis ogrožencev glede na vrsto, glede na količino pa le pri številu prebivalcev in IPPC zavezancev. Relevantnost popisanih in poročanih ogrožencev bo treba oceniti pri določitvi ciljev za posamezno območje.

Predlagamo tudi popravke kart poplavne ogroženosti v zvezi s številom potencialno ogroženih prebivalcev zaradi nove razmejitve območij veljavnosti rezultatov za pripadajoča območja pomembnega vpliva poplav ter izboljšavo vsebine kart z naslednjimi podatki o številu poslovnih subjektov in podatki o pomembnejši linijski infrastrukturi: elektrovodi, GJI (2101, 2102, 2103, 2104) z ATR2=1,2,3 (>=110 kV); plinovodi, GJI (2201) z ATR4=9,8,7,6,5; vodovodi, GJI (3101) z ATR4=1,2. Popravki se lahko izvedejo v sklopu naloge I/2/2 v obdobju do zaključnega poročanja konec leta.

  <Summary>
    <Summary1>"Zahteve poplavne direktive v zvezi s kartiranjem poplavne nevarnosti in ogroženosti so v nacionalni pravni red prenesene z Uredbo o vsebini in načinu priprave podrobnejšega načrta zmanjševanja ogroženosti pred poplavami (Ur. l. RS, št. 7/2010), ki določa vsebino kart, način priprave kart pa določa Pravilnik o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007). Metodološki pravilnik opredeljuje verjetnosti nastanka poplavne nevarnosti s standardnimi verjetnostmi nastopa pretokov s povratnimi dobami 10, 100 in 500 let, ki povzročijo poplavo. Za določitev vrednosti pretokov s petstoletno povratno dobo pravilnik dopušča poenostavljen izračun vrednosti, torej, za površino porečja nad 1000 km2 po enačbi Q500 = 1,2 * Q100, za površino porečja do 1000 km2 po enačbi Q500 = 1,3 * Q100 in za površino porečja do 100 km2 pa Q500 = 1,4 * Q100. Poplavljanje stoječih voda in morja je opredeljeno z vrednostmi gladin s povratnimi dobami 10, 100 in 500 let, katerih vrednosti se v primeru stoječih voda določijo z najvišjim izmerjenim ali izračunanim vodostajem, v primeru morja pa s seštevkom vrednosti gladine plimovanja s povratno dobo 10, 100 in 500 let in pripadajočega vala s povratno dobo 2, 2 oziroma 50 let.
Od leta 2007 naprej se navedeni poplavni scenariji uporabljajo pri izdelavi hidrološko-hidravličnih študij v postopkih pridobitve vodnega soglasja za posege v prostor, ki bi lahko trajno ali začasno vplivali na vodni režim ali stanje voda, torej pri posegih na poplavna območja. Karte poplavne nevarnosti in zlasti karte razredov poplavne nevarnosti, ki nastanejo s prostorskim kombiniranjem dosegov različnih povratnih dob, razredov globin in hitrosti, se uporabljajo kot strokovna podlaga za prostorske pogoje in omejitve kot jih določa Uredba o pogojih in omejitvah za izvajanje dejavnosti in posegov v prostor na območjih, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja (Ur. l. RS, št. 89/2008), katere izvajanje predstavlja razmeroma uspešen preventivni ukrep s ciljem omejitve oziroma zmanjšanja vnosa novega škodnega potenciala na poplavna območja.
V okviru predhodne ocene poplavne ogroženosti je bilo v Sloveniji opredeljenih 61 območij pomembnega vpliva poplav in za približno polovico območij je bilo treba v letih 2012 in 2013 zbrati razpoložljive podatke o poplavnih dosegih in globinah iz hidrološko-hidravličnih študij, izdelanih v letih 2007-2013 in potrjenih v postopkih preverjanja skladnosti z določbami metodološkega pravilnika, za preostalo polovico območij pomembnega vpliva poplav pa na novo izdelati karte poplavne nevarnosti oziroma jih prostorsko dopolniti. Karte poplavne nevarnosti se izdelujejo v merilu 1:5.000 ali večjem, na njih so prikazani dosegi 10, 100 in 500-letnih poplavnih voda in pri Q100 pripadajoči trije razredi globin (<0,5m; 0,5-1,5m; >1,5m) oz. na območjih s hitrostmi toka nad 1 m/s tudi trije razredi zmnožka globin in hitrosti toka (<0,5m2/s; 0,5-1,5m2/s; >1,5m2/s).
Kartiranje nevarnosti v splošnem temelji na enodimenzijskem hidrološkem modelu padavinskega odtoka na podlagi verjetnostne analize padavin oziroma podatkov vodomernih postaj ter na kombiniranem 1D-2D hidrodinamičnem modelu. Pri modeliranju so uporabljeni podatki temeljnih topografskih načrtov v merilu 1:5.000, podatki hidrogeološke karte, karte hidravlične prevodnosti tal, podatki o pokrovnosti Corine Land Cover, podatki DMV5m in podatki DMR1m, dobljeni s pomočjo LiDAR tehnike zajema geodetskih podatkov z višinsko natančnostjo ca. 7,5 cm in gostoto 10pik/m2, kakor tudi podatki terestričnega geodetskega snemanja prečnih profilov strug glavnih vodotokov in pritokov, premostitev, pragov, prepustov in drugih hidravlično pomembnih objektov ter podatki katastra stavb. Uporabljeni so naslednji podatki LiDAR snemanj: klasificirane točke, dobljene iz georeferenciranega oblaka točk z elipsoidnimi višinami, ki so uporabne na pritokih brez izmerjenih profilov; točke na razdalji 1m z nadmorskimi višinami, dobljene na podlagi interpolacije oblaka točk reliefa z nadmorskimi višinami; ortofoto posnetki. Za modeliranje padavine-odtok je uporabljeno programsko

orodje HEC-HMS, za hidravlično modeliranje v strugi in na območjih poplavljanja MIKE Flood, prostorske analize in kartiranje pa se je izvajalo z ArcGIS. Vpliv podnebnih sprememb oziroma vpliv napovedi sprememb povratnih dob obstoječih karakterističnih vrednosti pretokov v hidroloških analizah ni bil upoštevan, z analizo vseh zabeleženih padavinskih in pretočnih vrednosti pa je upoštevana podnebna spremenljivost. Dolgoročni načrtovani razvoj v analizah ni bil upoštevan, saj je od leta 2008 naprej vnos novega škodnega potenciala na poplavna območja omejen z določbami Uredbe o pogojih in omejitvah za izvajanje dejavnosti in posegov v prostor na območjih, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja (Ur. l. RS, št. 89/2008), v primeru širitve urbanizacije pa je predvideno, da se predhodno z omilitvenimi ukrepi zagotovi zmanjšanje obstoječe ogroženosti.
Podatkovni sloji karte poplavne nevarnosti, ki se nahajajo znotraj območij veljavnosti rezultatov hidrološko-hidravličnega modeliranja, se zbirajo in na pol leta posodobijo ter javno objavijo v rubriki VODE\POPLAVE v Atlasu okolja, ki ga vodi Agencija za okolje Republike Slovenije (gis.arso.gov.si/atlasokolja/). Osnovni namen objavljenih podatkovnih slojev je podrobnejši prikaz poplavnih razmer na določenem območju in zagotavljanje strokovne podlage za razvrščanje območij poplavljanja v razrede poplavne nevarnosti. Podatki so namenjeni tudi načrtovanju ukrepov zmanjševanja poplavne ogroženosti, načrtovanju prostorskih ureditev in posegov v prostor, obveščanju in ozaveščanju javnosti, načrtovanju ukrepov zaščite in reševanja, ter izvajanju mednarodnih obveznosti. Karte poplavne nevarnosti za posamezna območja pomembnega vpliva poplav, skupaj s tabelaričnim okvirjem spremljanja aktivnosti izvajanja poplavne direktive so objavljene na spletni strani MKO (mko.gov.si/si/delovna_podrocja/voda/poplavna_direktiva/). Evidenco hidrološko-hidravličnih študij, izdelanih skladno z določbami metodološkega pravilnika, vodita Agencija za okolje Republike Slovenije in Inštitut za vode Republike Slovenije, ki sodelujeta v postopkih preverjanja skladnosti študij z metodološkim pravilnikom."</Summary1>
<Summary2 />
<Summary3_1>Število ogroženih prebivalcev znotraj dosega posameznega poplavnega scenarija je določeno na podlagi prostorske analize podatkov Centralnega registra prebivalstva (Ministrstvo za notranje zadeve Republike Slovenije, 2014) in podatkov Registra prostorskih enot – evidence hišnih številk (Geodetska uprava Republike Slovenije, 2014). Upoštevani so stalni in začasni prebivalci, število ogrožencev je zaokroženo na 50 in na kartah poplavne ogroženosti simbolično prikazano na podlagi razvrstitve v štiri razrede (<50, 50-500, 500-1000, >1000).</Summary3_1>
<Summary3_2>Vrste ogroženih gospodarskih dejavnosti znotraj dosega posameznega poplavnega scenarija so določene na podlagi prostorske analize podatkovnega sloja rabe tal po nomenklaturi Corine Land Cover (European Environment Agency, 2006). Nacionalni podatkovni sloj dejanske rabe tal v merilu 1:5.000 (Ministrstvo za kmetijstvo in okolje, 2013) žal ne vključuje ločene kategorije »industrijske, trgovinske in transportne površine«, ampak ločuje med pozidanimi, kmetijskimi, gozdnimi in ostalimi zemljišči. Kljub premajhnemu merilu podatkovnega sloja so bile kategorije Corine Land Cover ustrezno reklasificirane v pet kategorij za prikaz na kartah ogroženosti in izdelavo popisa ogrožencev. S ciljem izboljšanja natančnosti informacij v zvezi z omenjeno kategorijo je bilo na podlagi prostorske analize Poslovnega registra Slovenije (Agencija Republike Slovenije za javnopravne evidence in storitve, 2010) in podatkov Registra prostorskih enot – evidence hišnih številk (Geodetska uprava Republike Slovenije, 2014) določeno število poslovnih subjektov (gospodarske in negospodarske dejavnosti) znotraj dosega posameznega poplavnega scenarija. Za izboljšanje kakovosti informacij v zvezi s transportnimi površinami so bili uporabljeni podatki Zbirnega katastra Gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011) o poteku tras cest in železnic.</Summary3_2>
<Summary3_3>Industrijske naprave, zavezanci IPPC direktive, ki se nahajajo znotraj dosega posameznega poplavnega scenarija, so določeni na podlagi prostorske analize podatkov Registra zavezancev IPPC (Agencija za okolje Republike Slovenije, 2014), objavljenih tudi v registru E-PRTR European Pollutant Release and Transfer Register (European Environment Agency). S ciljem izboljšanja natančnosti informacij v zvezi s potencialnim onesnaženjem so kartam poplavne ogroženosti dodani podatkovni sloji komunalnih čistilnih naprav (Agencija za okolje Republike Slovenije, 2013), komunalnih odlagališč iz Zbirnega katastra gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011) in prostorski podatki Registra zavezancev SEVESO direktive

(Agencija za okolje Republike Slovenije, 2014). Prostorska analiza teh slojev in slojev dosegov poplav je opredelila poplavno ogroženost posameznega IPPC zavezanca, pri čemer velja opozoriti na pomanjkljivost podatkovnega sloja, ki vsebuje točkovne objekte in ne poligonskih, zato obstaja možnost, da kljub poplavljenemu delu območja industrijske naprave, prostorska analiza objekta ne zazna kot ogroženca. Ravno zato so na kartah ogroženosti prikazane vse industrijske naprave (in tudi SEVESO obrati) znotraj območja veljavnosti rezultatov hidravličnega modela, za preveritev števila ogroženih IPPC zavezancev na poplavnih območjih različnih povratnih dob pa je bil poleg prostorskih analiz izveden pregled situacije v merilu 1:5.000 na podlagi digitalnih ortofoto posnetkov in podatkovnih slojev kart poplavne nevarnosti.</Summary3_3>

<Summary3_4>Določitev vpliva poplav na zavarovana območja okvirne vodne direktive, ki se nahajajo znotraj dosega posameznega poplavnega scenarija, je bila izvedena s pomočjo prostorskih analiz podatkovnih slojev vodovarstvenih območij, kopalnih voda, območij Natura2000, ki jih vodi Agencija za okolje Republike Slovenije (2011) in podatkovnih slojev ekološko pomembnih območij, naravnih vrednot in zavrovanih območij narave (Zavod Republike Slovenije za varstvo narave, 2011). Na kartah poplavne ogroženosti so območja Natura2000, ekološko pomembna območja, zavarovana območja narave in naravne vrednote združena v skupno območje varstva narave. Na kartah so prikazana tudi vodovarstvena območja, opredeljena z vladnimi uredbami in občinskimi odloki ter območja kopalnih voda, ki so opredeljena z Uredbo o upravljanju kakovosti kopalnih voda (Ur. l. RS, št. 25/2008). Prostorska analiza omenjenih podatkovnih slojev in slojev dosegov poplav je opredelila vpliv poplav na zavarovana območja okvirne vodne direktive.</Summary3_4>

<Summary3_5>Poleg ogroženosti zdravja ljudi, okolja, gospodarskih dejavnosti in kulturne dediščine se po Pravilniku o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007) obravnava tudi ogroženost občutljivih objektov, torej objektov, kjer je lahko otežena evakuacija (šole, vrtci, bolnišnice, zdravstveni domovi, domovi starostnikov in zdravilišča), kjer lahko nastanejo izjemne materialne in družbene škode (knjižnice, muzeji, arhivi) oziroma katerih poškodbe lahko povzročijo velike posredne gospodarske škode (transport, oskrba). Kot posebna vrsta ogrožencev so na kartah ogroženosti obravnavane tudi lokacije objektov služb za ukrepanje v sili (gasilske, reševalne in policijske postaje) ter komunalne čistilne naprave in komunalna odlagališča kot potencialni vir onesnaženja voda v primeru poplav. Za kartografski prikaz ogrožencev in analizo njihovega števila so bili uporabljeni podatkovni sloji Zbirnega katastra Gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011), evidence pristojnih ministrstev, Zavoda za varstvo kulturne dediščine (2011), Gasilske zveze Slovenije (2011), Ministrstva za delo, družino, socialne zadeve in enake možnosti (2011) in spletnega mesta Geopedia.si (Sinergise, d.o.o., 2011). Ogroženost kulturne dediščine je bila prikazana in analizirana na podlagi podatkov Registra nepremične kulturne dediščine (Ministrstvo za kulturo Republike Slovenije, 2011). Prostorska analiza omenjenih podatkovnih slojev in slojev dosegov poplav je opredelila vpliv na občutljive objekte, večje vire onesnaženja, objekte služb za ukrepanje v sili in na kulturno dediščino.</Summary3_5>

<Summary5>"Na podlagi kart poplavne nevarnosti, izdelanih v merilu 1:5.000, je bilo treba določiti lokacijo, vrsto in količino ogrožencev in na podlagi teh informacij se bo v načrtovalskem obdobju 2013-2015 določilo primerne cilje in izbralo ustrezne ukrepe za zmanjšanje poplavne ogroženosti območij pomembnega vpliva poplav. Osnovni namen izdelave kart poplavne ogroženosti za območja pomembnega vpliva poplav je prostorski prikaz škodnega potenciala, ki se nahaja znotraj dosega posameznega poplavnega scenarija, na ravni merila državnega načrtovanja (1:25.000). Pri izdelavi kart poplavne ogroženosti so bili večinoma uporabljeni podatkovni sloji za določitev škodnega potenciala iz predhodne ocene poplavne ogroženosti 2009-2011, za kartografsko podlago pa je uporabljena Državna topografska karta DTK50 (Geodetska uprava Republike Slovenije, 2010) in topografski podatki o vodotokih GKB25 (Geodetska uprava Republike Slovenije, 1996). Karte poplavne ogroženosti vsebujejo naslednje podatke: šola, vrtec; bolnišnica, zdravstveni dom, dom starostnikov, zdravilišče; knjižnica, muzej, arhiv; gasilci, reševalci, policija; IPPC naprava, SEVESO obrat, lokacija in območje varstva narave (območja Natura2000, ekološko pomembna območja, zavarovana območja, naravne vrednote), komunalno odlagališče, komunalna čistilna naprava; objekt vodne infrastrukture; vodotok I. ali II. reda, avtocesta ali hitra cesta; glavna cesta ali regionalna cesta; železniška proga; število

ogroženih prebivalcev na območju poplavljanja; območje veljavnosti rezultatov hidrološko-hidravličnih študij; območje pomembnega vpliva poplav; kulturni spomenik državnega ali lokalnega pomena; vodovarstveno območje državne ali občinske ravni; območje kopalne vode; raba tal po nomenklaturi Corine Land Cover. Škodni potencial je prikazan na območjih poplavljanja Q10, Q100 in Q500 znotraj skupnega območja veljavnosti rezultatov hidrološko-hidravličnih modelov, le pri IPPC napravah in SEVESO obratih so izjemoma prikazani vsi objekti znotraj območij veljavnosti rezultatov hidrološko-hidravličnih študij in ne le znotraj treh poplavnih območij, saj sodijo ti objekti med pomembne ogrožence, geolocirani pa so točkovno in zato ni mogoče zanesljivo vedeti, ali se območje objekta nahaja delno znotraj območij poplavljanja. Objekti vodne infrastrukture so prikazani v smislu kartografske podlage.
Karte poplavne nevarnosti izkazujejo določene omejitve pri uporabi, npr. kljub sodobnim tehnikam zajema podatkov in modeliranja se rezultati lahko razlikujejo od zabeleženih poplavnih dogodkov zaradi: geomorfoloških sprememb in erozijskih učinkov ter njihovega vpliva na hidravlične razmere in pretočnost strug vodotokov; nepredvidenih zamašitev mostov in prepustov zaradi večje količine drobirja in plavja; tehničnih omejitev glede velikosti mrežnih celic, števila profilov in objektov; geodetskih podatkov (terenska izmera profilov, objektov, prepustov in premostitev na vseh pritokih). Poleg tega je praksa pri hidravličnem modeliranju taka, da se stavbe pri modeliranju upošteva kot visoke zidove in posledično se v rezultatih modeliranja take stavbe znajdejo izven poplavnega območja, čeprav voda z določeno globino sega do zunanjega gabarita stavbe.
Karte poplavne ogroženosti izkazujejo omejitve pri uporabi predvsem zaradi merila izdelave, sama statistika ogrožencev pa je zaradi natančnosti vhodnih podatkov pri nekaterih vrstah ogrožencev manj zanesljiva. Zaradi različne ravni prostorskih analiz in različnih uporabljenih podatkov o poplavni nevarnosti se ponekod slabše ujemata analiza ogrožencev območij pomembnega vpliva poplav in analiza ogrožencev poplavnih območij kart poplavne ogroženosti, glavni razlog pa je prevelika potencialnost ogroženosti območij pomembnega vpliva poplav. Pri prostorskih analizah predstavljajo težavo tudi točkovni podatki namesto poligonskih, ki poslabšajo natančnost glede na natančnost podatka o dosegih poplav, zato je treba ponekod situacijo pregledati s pomočjo digitalnih ortofoto posnetkov v merilu 1:5.000.
Določitev in prikaz poplavnih območij je predvidena v vodnem katastru in prostorskem informacijskem sistemu s Pravilnikom o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007), skupaj z obnovo in dopolnitvijo podatkov na šest let. Podatkovni sloji kart poplavne nevarnosti so javno objavljeni v rubriki VODE\POPLAVE na spletnem Atlasu okolja, ki ga vodi Agencija za okolje Republike Slovenije (gis.arso.gov.si/atlasokolja/). Izdelane karte poplavne nevarnosti in karte poplavne ogroženosti za območja pomembnega vpliva poplav so objavljene v preglednici na spletnem naslovu Ministrstva za kmetijstvo in okolje Republike Slovenije:

http://www.mko.gov.si/fileadmin/mko.gov.si/pageuploads/podrocja/voda/opvp/OPOPO.xls

Osnovni namen objavljenih podatkovnih slojev je prikaz poplavnih razmer na določenem območju, podatki pa so namenjeni tudi načrtovanju ukrepov zmanjševanja poplavne ogroženosti, načrtovanju prostorskih ureditev in posegov v prostor, obveščanju in ozaveščanju javnosti, načrtovanju ukrepov zaščite in reševanja, ter izvajanju mednarodnih obveznosti.

  <Summary>
    <Summary1>Zahteve poplavne direktive v zvezi s kartiranjem poplavne nevarnosti in ogroženosti so v nacionalni pravni red prenesene z Uredbo o vsebini in načinu priprave podrobnejšega načrta zmanjševanja ogroženosti pred poplavami (Ur. l. RS, št. 7/2010), ki določa vsebino kart, način priprave kart pa določa Pravilnik o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007). Metodološki pravilnik opredeljuje verjetnosti nastanka poplavne nevarnosti s standardnimi verjetnostmi nastopa pretokov s povratnimi dobami 10, 100 in 500 let, ki povzročijo poplavo. Za določitev vrednosti pretokov s petstoletno povratno dobo pravilnik dopušča poenostavljen izračun vrednosti, torej, za površino porečja nad 1000 km2 po enačbi Q500 = 1,2 * Q100, za površino porečja do 1000 km2 po enačbi Q500 = 1,3 * Q100 in za površino porečja do 100 km2 pa Q500 = 1,4 * Q100. Poplavljanje stoječih voda in morja je opredeljeno z vrednostmi gladin s povratnimi dobami 10, 100 in 500 let, katerih vrednosti se v primeru stoječih voda določijo z najvišjim izmerjenim ali izračunanim vodostajem, v primeru morja pa s seštevkom vrednosti gladine plimovanja s povratno dobo 10, 100 in 500 let in pripadajočega vala s povratno dobo 2, 2 oziroma 50 let.
Od leta 2007 naprej se navedeni poplavni scenariji uporabljajo pri izdelavi hidrološko-hidravličnih študij v postopkih pridobitve vodnega soglasja za posege v prostor, ki bi lahko trajno ali začasno vplivali na vodni režim ali stanje voda, torej pri posegih na poplavna območja. Karte poplavne nevarnosti in zlasti karte razredov poplavne nevarnosti, ki nastanejo s prostorskim kombiniranjem dosegov različnih povratnih dob, razredov globin in hitrosti, se uporabljajo kot strokovna podlaga za prostorske pogoje in omejitve kot jih določa Uredba o pogojih in omejitvah za izvajanje dejavnosti in posegov v prostor na območjih, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja (Ur. l. RS, št. 89/2008), katere izvajanje predstavlja razmeroma uspešen preventivni ukrep s ciljem omejitve oziroma zmanjšanja vnosa novega škodnega potenciala na poplavna območja.
V okviru predhodne ocene poplavne ogroženosti je bilo v Sloveniji opredeljenih 61 območij pomembnega vpliva poplav in za približno polovico območij je bilo treba v letih 2012 in 2013 zbrati razpoložljive podatke o poplavnih dosegih in globinah iz hidrološko-hidravličnih študij, izdelanih v letih 2007-2013 in potrjenih v postopkih preverjanja skladnosti z določbami metodološkega pravilnika, za preostalo polovico območij pomembnega vpliva poplav pa na novo izdelati karte poplavne nevarnosti oziroma jih prostorsko dopolniti. Karte poplavne nevarnosti se izdelujejo v merilu 1:5.000 ali večjem, na njih so prikazani dosegi 10, 100 in 500-letnih poplavnih voda in pri Q100 pripadajoči trije razredi globin (<0,5m; 0,5-1,5m; >1,5m) oz. na območjih s hitrostmi toka nad 1 m/s tudi trije razredi zmnožka globin in hitrosti toka (<0,5m2/s; 0,5-1,5m2/s; >1,5m2/s).
Kartiranje nevarnosti v splošnem temelji na enodimenzijskem hidrološkem modelu padavinskega odtoka na podlagi verjetnostne analize padavin oziroma podatkov vodomernih postaj ter na kombiniranem 1D-2D hidrodinamičnem modelu. Pri modeliranju so uporabljeni podatki temeljnih topografskih načrtov v merilu 1:5.000, podatki hidrogeološke karte, karte hidravlične prevodnosti tal, podatki o pokrovnosti Corine Land Cover, podatki DMV5m in podatki DMR1m, dobljeni s pomočjo LiDAR tehnike zajema geodetskih podatkov z višinsko natančnostjo ca. 7,5 cm in gostoto 10pik/m2, kakor tudi podatki terestričnega geodetskega snemanja prečnih profilov strug glavnih vodotokov in pritokov, premostitev, pragov, prepustov in drugih hidravlično pomembnih objektov ter podatki katastra stavb. Uporabljeni so naslednji podatki LiDAR snemanj: klasificirane točke, dobljene iz georeferenciranega oblaka točk z elipsoidnimi višinami, ki so uporabne na pritokih brez izmerjenih profilov; točke na razdalji 1m z nadmorskimi višinami, dobljene na podlagi interpolacije oblaka točk reliefa z nadmorskimi višinami; ortofoto posnetki. Za modeliranje padavine-odtok je uporabljeno programsko

orodje HEC-HMS, za hidravlično modeliranje v strugi in na območjih poplavljanja MIKE Flood, prostorske analize in kartiranje pa se je izvajalo z ArcGIS. Vpliv podnebnih sprememb oziroma vpliv napovedi sprememb povratnih dob obstoječih karakterističnih vrednosti pretokov v hidroloških analizah ni bil upoštevan, z analizo vseh zabeleženih padavinskih in pretočnih vrednosti pa je upoštevana podnebna spremenljivost. Dolgoročni načrtovani razvoj v analizah ni bil upoštevan, saj je od leta 2008 naprej vnos novega škodnega potenciala na poplavna območja omejen z določbami Uredbe o pogojih in omejitvah za izvajanje dejavnosti in posegov v prostor na območjih, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja (Ur. l. RS, št. 89/2008), v primeru širitve urbanizacije pa je predvideno, da se predhodno z omilitvenimi ukrepi zagotovi zmanjšanje obstoječe ogroženosti.
Podatkovni sloji karte poplavne nevarnosti, ki se nahajajo znotraj območij veljavnosti rezultatov hidrološko-hidravličnega modeliranja, se zbirajo in na pol leta posodobijo ter javno objavijo v rubriki VODE\POPLAVE v Atlasu okolja, ki ga vodi Agencija za okolje Republike Slovenije (gis.arso.gov.si/atlasokolja/). Osnovni namen objavljenih podatkovnih slojev je podrobnejši prikaz poplavnih razmer na določenem območju in zagotavljanje strokovne podlage za razvrščanje območij poplavljanja v razrede poplavne nevarnosti. Podatki so namenjeni tudi načrtovanju ukrepov zmanjševanja poplavne ogroženosti, načrtovanju prostorskih ureditev in posegov v prostor, obveščanju in ozaveščanju javnosti, načrtovanju ukrepov zaščite in reševanja, ter izvajanju mednarodnih obveznosti. Karte poplavne nevarnosti za posamezna območja pomembnega vpliva poplav, skupaj s tabelaričnim okvirjem spremljanja aktivnosti izvajanja poplavne direktive so objavljene na spletni strani MKO (mko.gov.si/si/delovna_podrocja/voda/poplavna_direktiva/). Evidenco hidrološko-hidravličnih študij, izdelanih skladno z določbami metodološkega pravilnika, vodita Agencija za okolje Republike Slovenije in Inštitut za vode Republike Slovenije, ki sodelujeta v postopkih preverjanja skladnosti študij z metodološkim pravilnikom.</Summary1>
<Summary2 />
<Summary3_1>Število ogroženih prebivalcev znotraj dosega posameznega poplavnega scenarija je določeno na podlagi prostorske analize podatkov Centralnega registra prebivalstva (Ministrstvo za notranje zadeve Republike Slovenije, 2014) in podatkov Registra prostorskih enot – evidence hišnih številk (Geodetska uprava Republike Slovenije, 2014). Upoštevani so stalni in začasni prebivalci, število ogrožencev je zaokroženo na 50 in na kartah poplavne ogroženosti simbolično prikazano na podlagi razvrstitve v štiri razrede (<50, 50-500, 500-1000, >1000).</Summary3_1>
<Summary3_2>Vrste ogroženih gospodarskih dejavnosti znotraj dosega posameznega poplavnega scenarija so določene na podlagi prostorske analize podatkovnega sloja rabe tal po nomenklaturi Corine Land Cover (European Environment Agency, 2006). Nacionalni podatkovni sloj dejanske rabe tal v merilu 1:5.000 (Ministrstvo za kmetijstvo in okolje, 2013) žal ne vključuje ločene kategorije »industrijske, trgovinske in transportne površine«, ampak ločuje med pozidanimi, kmetijskimi, gozdnimi in ostalimi zemljišči. Kljub premajhnemu merilu podatkovnega sloja so bile kategorije Corine Land Cover ustrezno reklasificirane v pet kategorij za prikaz na kartah ogroženosti in izdelavo popisa ogrožencev. S ciljem izboljšanja natančnosti informacij v zvezi z omenjeno kategorijo je bilo na podlagi prostorske analize Poslovnega registra Slovenije (Agencija Republike Slovenije za javnopravne evidence in storitve, 2010) in podatkov Registra prostorskih enot – evidence hišnih številk (Geodetska uprava Republike Slovenije, 2014) določeno število poslovnih subjektov (gospodarske in negospodarske dejavnosti) znotraj dosega posameznega poplavnega scenarija. Za izboljšanje kakovosti informacij v zvezi s transportnimi površinami so bili uporabljeni podatki Zbirnega katastra Gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011) o poteku tras cest in železnic.</Summary3_2>
<Summary3_3>Industrijske naprave, zavezanci IPPC direktive, ki se nahajajo znotraj dosega posameznega poplavnega scenarija, so določeni na podlagi prostorske analize podatkov Registra zavezancev IPPC (Agencija za okolje Republike Slovenije, 2014), objavljenih tudi v registru E-PRTR European Pollutant Release and Transfer Register (European Environment Agency). S ciljem izboljšanja natančnosti informacij v zvezi s potencialnim onesnaženjem so kartam poplavne ogroženosti dodani podatkovni sloji komunalnih čistilnih naprav (Agencija za okolje Republike Slovenije, 2013), komunalnih odlagališč iz Zbirnega katastra gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011) in prostorski podatki Registra zavezancev SEVESO direktive

(Agencija za okolje Republike Slovenije, 2014). Prostorska analiza teh slojev in slojev dosegov poplav je opredelila poplavno ogroženost posameznega IPPC zavezanca, pri čemer velja opozoriti na pomanjkljivost podatkovnega sloja, ki vsebuje točkovne objekte in ne poligonskih, zato obstaja možnost, da kljub poplavljenemu delu območja industrijske naprave, prostorska analiza objekta ne zazna kot ogroženca. Ravno zato so na kartah ogroženosti prikazane vse industrijske naprave (in tudi SEVESO obrati) znotraj območja veljavnosti rezultatov hidravličnega modela, za preveritev števila ogroženih IPPC zavezancev na poplavnih območjih različnih povratnih dob pa je bil poleg prostorskih analiz izveden pregled situacije v merilu 1:5.000 na podlagi digitalnih ortofoto posnetkov in podatkovnih slojev kart poplavne nevarnosti.</Summary3_3>

<Summary3_4>Določitev vpliva poplav na zavarovana območja okvirne vodne direktive, ki se nahajajo znotraj dosega posameznega poplavnega scenarija, je bila izvedena s pomočjo prostorskih analiz podatkovnih slojev vodovarstvenih območij, kopalnih voda, območij Natura2000, ki jih vodi Agencija za okolje Republike Slovenije (2011) in podatkovnih slojev ekološko pomembnih območij, naravnih vrednot in zavrovanih območij narave (Zavod Republike Slovenije za varstvo narave, 2011). Na kartah poplavne ogroženosti so območja Natura2000, ekološko pomembna območja, zavarovana območja narave in naravne vrednote združena v skupno območje varstva narave. Na kartah so prikazana tudi vodovarstvena območja, opredeljena z vladnimi uredbami in občinskimi odloki ter območja kopalnih voda, ki so opredeljena z Uredbo o upravljanju kakovosti kopalnih voda (Ur. l. RS, št. 25/2008). Prostorska analiza omenjenih podatkovnih slojev in slojev dosegov poplav je opredelila vpliv poplav na zavarovana območja okvirne vodne direktive.</Summary3_4>

<Summary3_5>Poleg ogroženosti zdravja ljudi, okolja, gospodarskih dejavnosti in kulturne dediščine se po Pravilniku o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007) obravnava tudi ogroženost občutljivih objektov, torej objektov, kjer je lahko otežena evakuacija (šole, vrtci, bolnišnice, zdravstveni domovi, domovi starostnikov in zdravilišča), kjer lahko nastanejo izjemne materialne in družbene škode (knjižnice, muzeji, arhivi) oziroma katerih poškodbe lahko povzročijo velike posredne gospodarske škode (transport, oskrba). Kot posebna vrsta ogrožencev so na kartah ogroženosti obravnavane tudi lokacije objektov služb za ukrepanje v sili (gasilske, reševalne in policijske postaje) ter komunalne čistilne naprave in komunalna odlagališča kot potencialni vir onesnaženja voda v primeru poplav. Za kartografski prikaz ogrožencev in analizo njihovega števila so bili uporabljeni podatkovni sloji Zbirnega katastra Gospodarske javne infrastrukture (Geodetska uprava Republike Slovenije, 2011), evidence pristojnih ministrstev, Zavoda za varstvo kulturne dediščine (2011), Gasilske zveze Slovenije (2011), Ministrstva za delo, družino, socialne zadeve in enake možnosti (2011) in spletnega mesta Geopedia.si (Sinergise, d.o.o., 2011). Ogroženost kulturne dediščine je bila prikazana in analizirana na podlagi podatkov Registra nepremične kulturne dediščine (Ministrstvo za kulturo Republike Slovenije, 2011). Prostorska analiza omenjenih podatkovnih slojev in slojev dosegov poplav je opredelila vpliv na občutljive objekte, večje vire onesnaženja, objekte služb za ukrepanje v sili in na kulturno dediščino.</Summary3_5>

<Summary5>"Na podlagi kart poplavne nevarnosti, izdelanih v merilu 1:5.000, je bilo treba določiti lokacijo, vrsto in količino ogrožencev in na podlagi teh informacij se bo v načrtovalskem obdobju 2013-2015 določilo primerne cilje in izbralo ustrezne ukrepe za zmanjšanje poplavne ogroženosti območij pomembnega vpliva poplav. Osnovni namen izdelave kart poplavne ogroženosti za območja pomembnega vpliva poplav je prostorski prikaz škodnega potenciala, ki se nahaja znotraj dosega posameznega poplavnega scenarija, na ravni merila državnega načrtovanja (1:25.000). Pri izdelavi kart poplavne ogroženosti so bili večinoma uporabljeni podatkovni sloji za določitev škodnega potenciala iz predhodne ocene poplavne ogroženosti 2009-2011, za kartografsko podlago pa je uporabljena Državna topografska karta DTK50 (Geodetska uprava Republike Slovenije, 2010) in topografski podatki o vodotokih GKB25 (Geodetska uprava Republike Slovenije, 1996). Karte poplavne ogroženosti vsebujejo naslednje podatke: šola, vrtec; bolnišnica, zdravstveni dom, dom starostnikov, zdravilišče; knjižnica, muzej, arhiv; gasilci, reševalci, policija; IPPC naprava, SEVESO obrat, lokacija in območje varstva narave (območja Natura2000, ekološko pomembna območja, zavarovana območja, naravne vrednote), komunalno odlagališče, komunalna čistilna naprava; objekt vodne infrastrukture; vodotok I. ali II. reda, avtocesta ali hitra cesta; glavna cesta ali regionalna cesta; železniška proga; število

ogroženih prebivalcev na območju poplavljanja; območje veljavnosti rezultatov hidrološko-hidravličnih študij; območje pomembnega vpliva poplav; kulturni spomenik državnega ali lokalnega pomena; vodovarstveno območje državne ali občinske ravni; območje kopalne vode; raba tal po nomenklaturi Corine Land Cover. Škodni potencial je prikazan na območjih poplavljanja Q10, Q100 in Q500 znotraj skupnega območja veljavnosti rezultatov hidrološko-hidravličnih modelov, le pri IPPC napravah in SEVESO obratih so izjemoma prikazani vsi objekti znotraj območij veljavnosti rezultatov hidrološko-hidravličnih študij in ne le znotraj treh poplavnih območij, saj sodijo ti objekti med pomembne ogrožence, geolocirani pa so točkovno in zato ni mogoče zanesljivo vedeti, ali se območje objekta nahaja delno znotraj območij poplavljanja. Objekti vodne infrastrukture so prikazani v smislu kartografske podlage.
Karte poplavne nevarnosti izkazujejo določene omejitve pri uporabi, npr. kljub sodobnim tehnikam zajema podatkov in modeliranja se rezultati lahko razlikujejo od zabeleženih poplavnih dogodkov zaradi: geomorfoloških sprememb in erozijskih učinkov ter njihovega vpliva na hidravlične razmere in pretočnost strug vodotokov; nepredvidenih zamašitev mostov in prepustov zaradi večje količine drobirja in plavja; tehničnih omejitev glede velikosti mrežnih celic, števila profilov in objektov; geodetskih podatkov (terenska izmera profilov, objektov, prepustov in premostitev na vseh pritokih). Poleg tega je praksa pri hidravličnem modeliranju taka, da se stavbe pri modeliranju upošteva kot visoke zidove in posledično se v rezultatih modeliranja take stavbe znajdejo izven poplavnega območja, čeprav voda z določeno globino sega do zunanjega gabarita stavbe.
Karte poplavne ogroženosti izkazujejo omejitve pri uporabi predvsem zaradi merila izdelave, sama statistika ogrožencev pa je zaradi natančnosti vhodnih podatkov pri nekaterih vrstah ogrožencev manj zanesljiva. Zaradi različne ravni prostorskih analiz in različnih uporabljenih podatkov o poplavni nevarnosti se ponekod slabše ujemata analiza ogrožencev območij pomembnega vpliva poplav in analiza ogrožencev poplavnih območij kart poplavne ogroženosti, glavni razlog pa je prevelika potencialnost ogroženosti območij pomembnega vpliva poplav. Pri prostorskih analizah predstavljajo težavo tudi točkovni podatki namesto poligonskih, ki poslabšajo natančnost glede na natančnost podatka o dosegih poplav, zato je treba ponekod situacijo pregledati s pomočjo digitalnih ortofoto posnetkov v merilu 1:5.000.
Določitev in prikaz poplavnih območij je predvidena v vodnem katastru in prostorskem informacijskem sistemu s Pravilnikom o metodologiji za določanje območij, ogroženih zaradi poplav in z njimi povezane erozije celinskih voda in morja, ter o načinu razvrščanja zemljišč v razrede ogroženosti (Ur. l. RS, št. 60/2007), skupaj z obnovo in dopolnitvijo podatkov na šest let. Podatkovni sloji kart poplavne nevarnosti so javno objavljeni v rubriki VODE\POPLAVE na spletnem Atlasu okolja, ki ga vodi Agencija za okolje Republike Slovenije (gis.arso.gov.si/atlasokolja/). Izdelane karte poplavne nevarnosti in karte poplavne ogroženosti za območja pomembnega vpliva poplav so objavljene v preglednici na spletnem naslovu Ministrstva za kmetijstvo in okolje Republike Slovenije:

http://www.mko.gov.si/fileadmin/mko.gov.si/pageuploads/podrocja/voda/opvp/OPOPO.xls

Osnovni namen objavljenih podatkovnih slojev je prikaz poplavnih razmer na določenem območju, podatki pa so namenjeni tudi načrtovanju ukrepov zmanjševanja poplavne ogroženosti, načrtovanju prostorskih ureditev in posegov v prostor, obveščanju in ozaveščanju javnosti, načrtovanju ukrepov zaščite in reševanja, ter izvajanju mednarodnih obveznosti.
